# 1. Note

Due to technical constraints, the program can process a maximum of 1,000 images in one go. If you try to add more files than that to a project, you will see the following message:

If you need to optimize more than 1,000 images, we recommend creating separate subfolders with each containing a maximum of 1000 files. You can then process each folder as a separate project.

# 2. Overview

1: The thumbnail browser is used for folder navigation and displays miniature previews for the contained images.

2: The preview pane provides a preview of the selected picture. Here, you may supervise the success of the optimization and access the optimize controls.

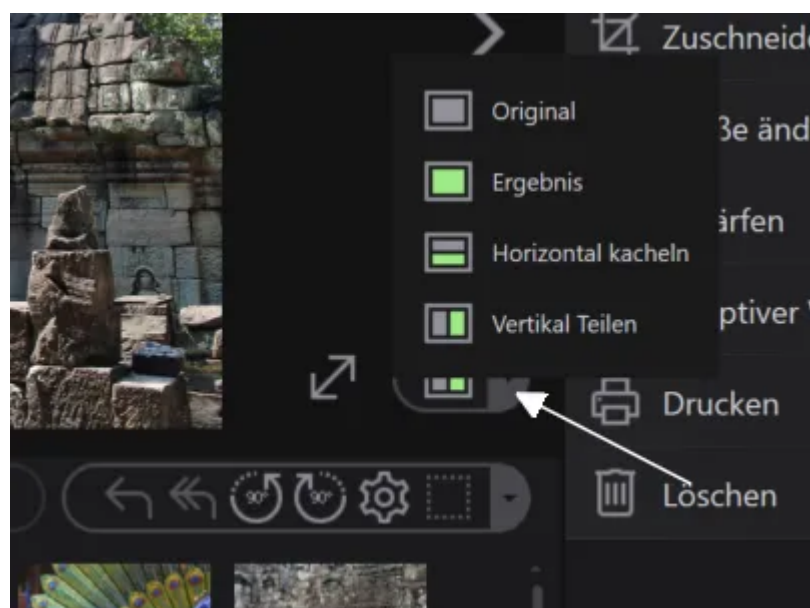

3: Available functions appear here.

## 2.1 Split screen

The view bar offers a special functions to customize the split screen that offers an integrated before-and-after view. This makes it easy to compare the before and after states of an optimization as demonstrated in the screenshot above with the original dull image on the left and the optimized vivid image on the right. The separator line is draggable to adjust the split view as needed.

## Split screen display modes

The split screen view supports four different display modes accessible through the arrow

symbol next to the star icon.

- Original (no effects preview)
- Result (effects preview only)
- Tile horizontal (top-bottom separation: original top, optimized bottom)
- Tile vertical (left-right separation: original left, optimized right)

## 2.2 Preview pane display modes

Clicking the two opposite facing arrows will hide the folder and file browser panes leaving more room for the preview pane. Clicking the now facing arrows again, will switch back to the previous display mode.

Manual zooming is possible through the slide control either by dragging the knob or clicking the +/- controls. You may alternatively use your mouse wheel to zoom in and out.

Use the D-pad to scroll within images whose boundaries exceed the visible screen area.

## 2.3 Image rotation

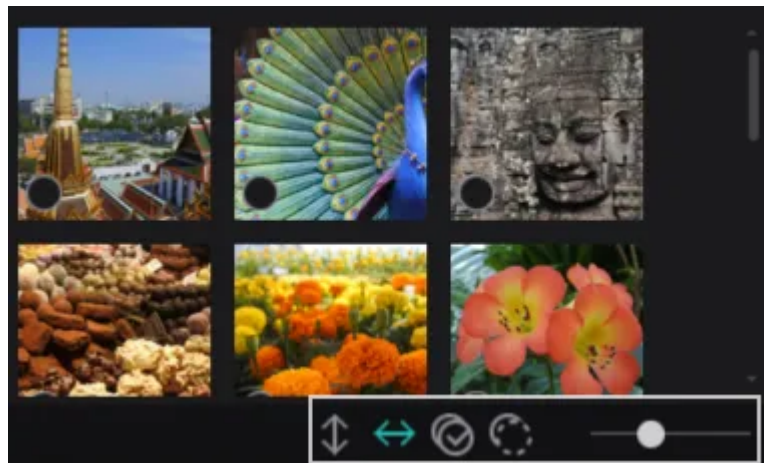

Ashampoo Photo Optimizer provides separate controls to quickly turn images 90°

clockwise or counterclockwise. They are located on the toolbar to the left of the functions pane (red rectangle).

## 2.4 Thumbnail display options and selection controls

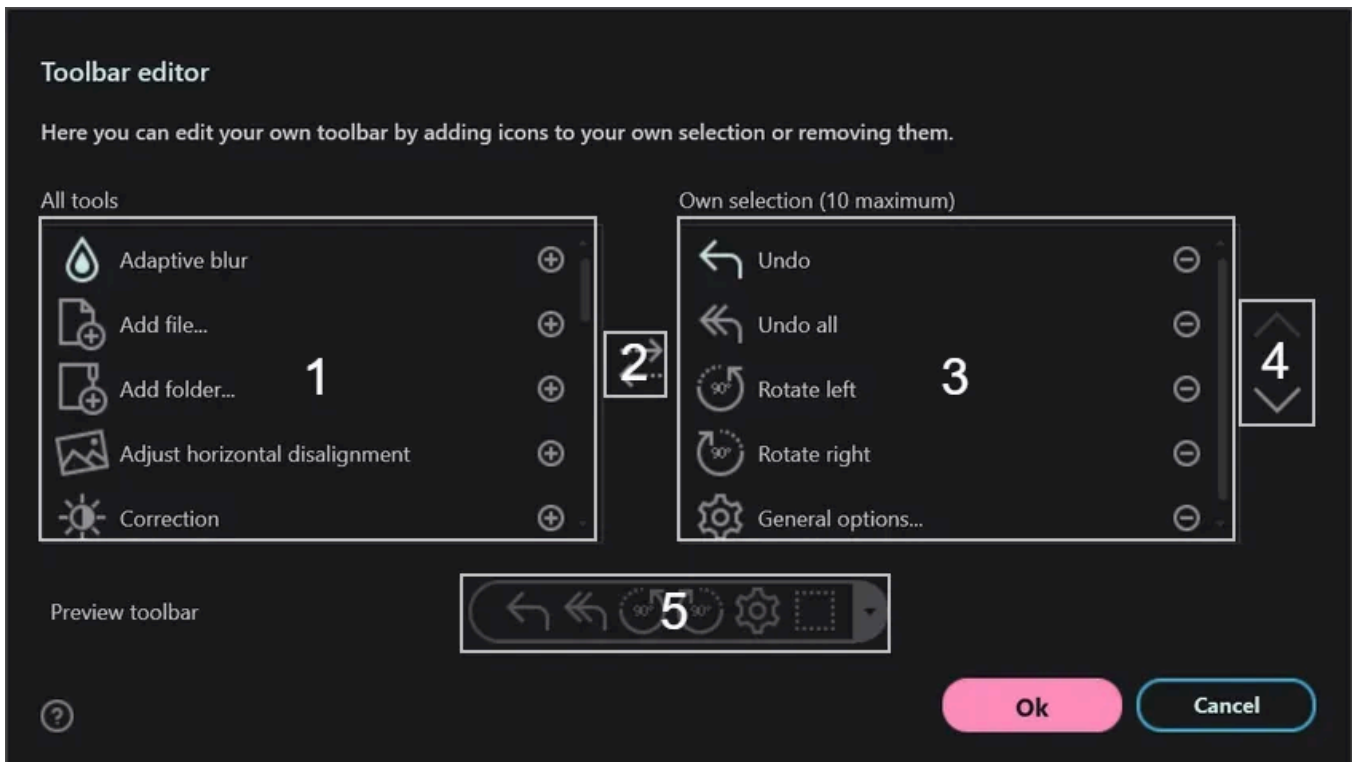

For convenience, you will find buttons to select/deselect all images within a folder below the thumbnail previews. Use the adjacent arrow buttons to layout the thumbnails horizontally (column view) or vertically (list view). The size of the thumbnails is smoothly adjustable through the slider control.

## 2.5 Toolbar customization

With Ashampoo Photo Optimizer, you can customize the quick access toolbar to your needs with a few simple steps. Click the arrow next to the toolbar to bring up the list of available features.

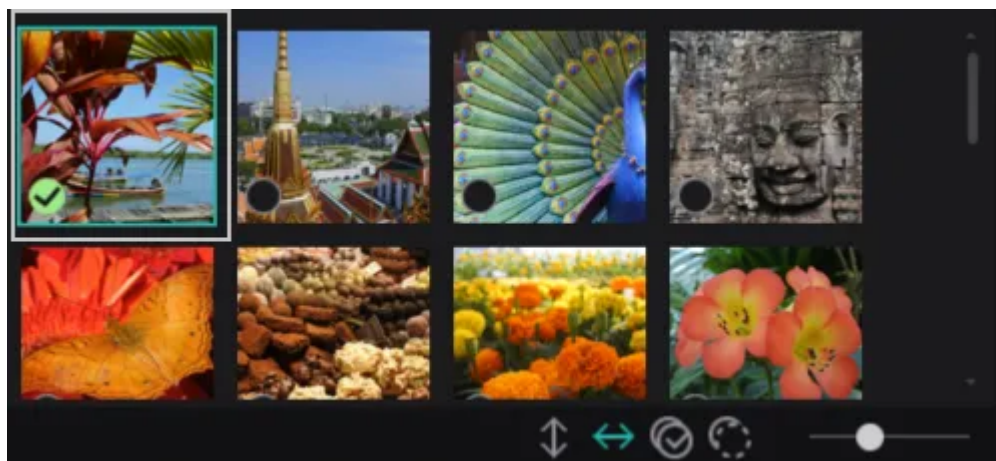

Available functions are listed on the left (1). Use the plus symbol to add the associated function to the toolbar. To swap functions between the repository and the toolbar, use the button in the middle (2). Functions currently on the toolbar are shown on the right (3). Use the minus symbol to remove the associated function from the toolbar. Use the up and down arrows (4) to change the sort order. A preview of the actual toolbar is shown below the lists (5).

## 3. Optimizing images

Imagine you have just returned from vacation with a couple of photos you took. First, you copy your images to your local harddisk. Then, you launch the product and open the image folder.

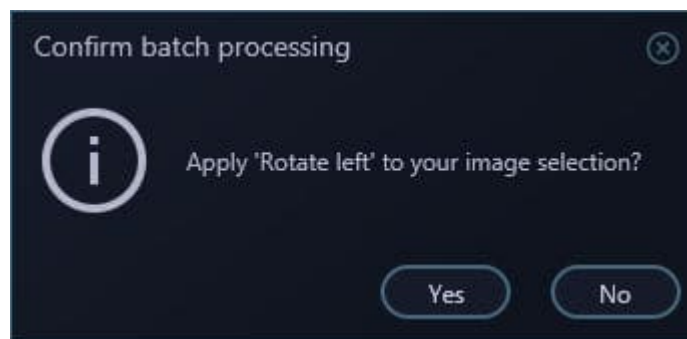

You may now select the desired image. It will appear in the preview pane. Now, click Auto Optimize.

The split view now displays the unaltered image on the left and the optimized image on the right. Select Save to keep the changes. To discard the changes, simply navigate to another image and cancel the save prompt or select Edit → Undo.

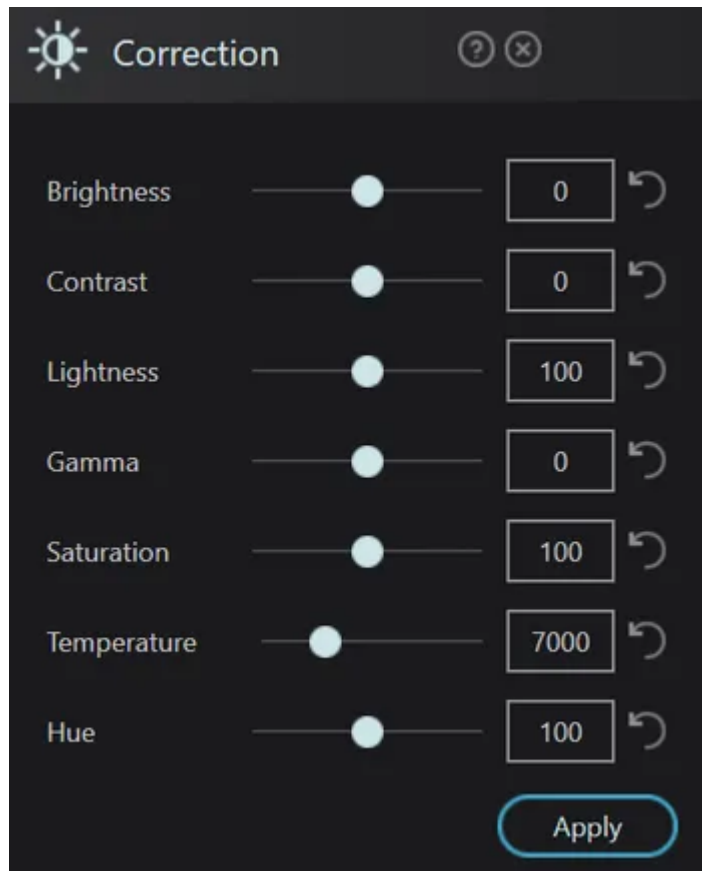

## Selecting and processing single images

To select multiple images from the thumbnail pane, hold Ctrl (usually next to the Windows key) and sequentially click the desired images. Your images will appear on a virtual corkboard as shown above.

Now, apply your desired effect and select Yes in the confirmation prompt to finish the operation.

## 4. Correction

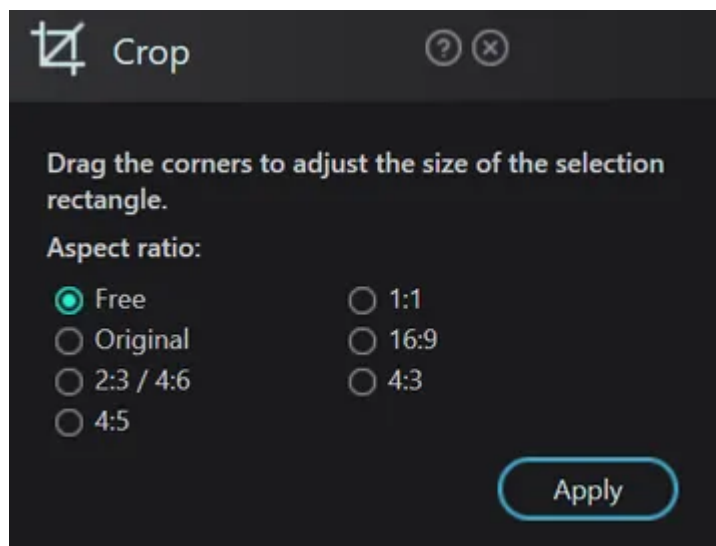

Use the sliders to adjust various image aspects like bright, contrast and saturation. Use the arrow buttons to reset the associated sliders to their default values.

## 5. Rotate / Mirror

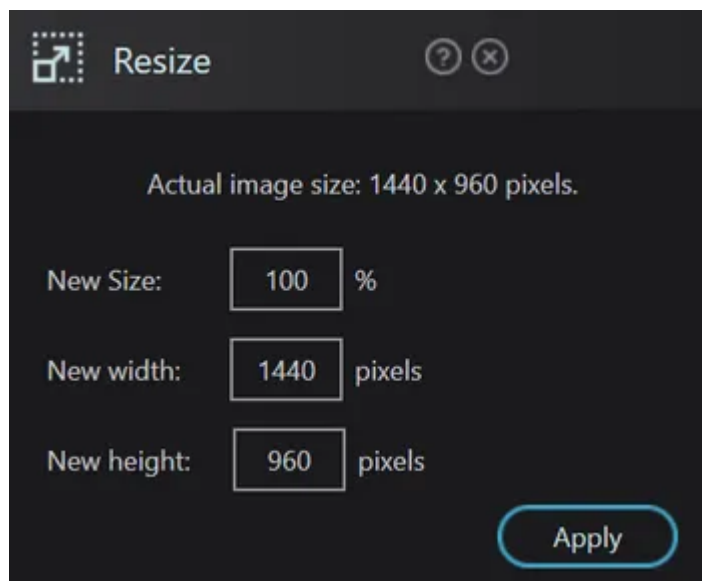

Rotates photos 90° left / right or mirrors them vertically / horizontally.

## 6. Crop

Simply drag the corners to adjust the clip or select a preset.

## 7. Resize

Either enter a percentage value to scale the image accordingly or use the width and height input areas to enter pixel values.

## 8. Sharpen

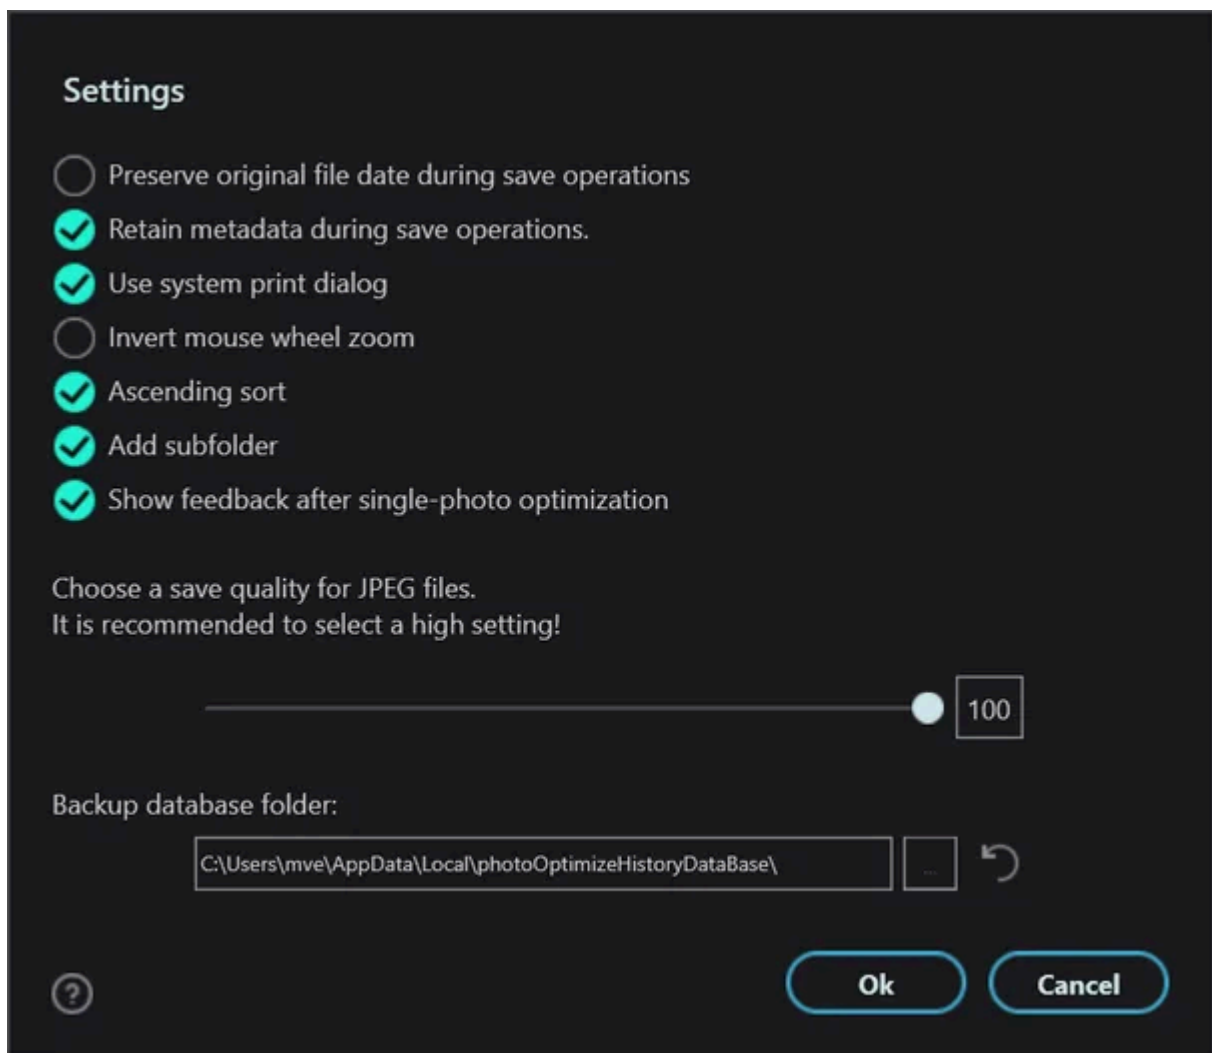

Use the slider to adjust the strength of the effect.

## 9. Adaptive Blur

This effect analyzes your image and intelligently adjusts the effect strength based on existing pixels and colors in your image. Use the slider to set an initial strength.

## 10. Settings

### Rotate and mirror images based on exif-orientation

Modern cameras store additional details such as the orientation of the camera, e.g. when holding it upside down. Activate this setting to have Ashampoo Photo Optimizer automatically rotate and align images properly.

### Preserve original file date during save operations

Many image viewers and organizers depend on the creation date associated with each image to order and sort them. Enable this setting to have Ashampoo Photo Optimizer preserve the original creation date file write operations.

### Invert mouse wheel zoom

By default, scrolling up/down will zoom in/out. Enable this feature to invert mouse zooming.

### Ascending sort

Does not use a natural sort order when displaying file lists, e.g. causing 10 to come before 2.

### Add subfolder

If enabled, photos in subfolders will also be added to the selection when you add a folder.

### Show feedback after single-photo / multi-photo optimization

If enabled, the program will present you with brief feedback on the steps that were necessary to optimize the selected photo(s).

### **JPEG-Quality**

Sets the compression ratio for JPEG images (0 = maximum compression, 100 = no compression). Lower compression ratios will increase image quality but consume more disk space. Unless you are low on disk space, select a high quality setting or leave this option unchanged.

### **Backup database folder**

Ashampoo Photo Optimizer creates backup files of your original images prior to each optimization. Unlike as with previous versions, in Ashampoo Photo Optimizer, the output path is customizable. By default, the following output path is used:

C:\Users\USERNAME\AppData\Local\photoOptimizeHistoryDataBase

Note that the files are located on your system partition (usually C:\) and that you will need to replace USERNAME with your Windows login user name. Select ... to specify a different output path. All existing backup files will be transferred to the new location. Select the round arrow symbol to restore the default output path.
