[6.3 AI settings](#)

1. Basics

Most sections follow the layout "source text (1), AI settings (2), target text (3)". Simply input your text into the source text field, adjust the AI settings and start processing. The result will then appear in the target text field.

Depending on the feature, additional buttons to copy the text to the clipboard (4) or insert it into the previously active window (5) will appear next to generated text entries.

There may also be a link-based shortcut to the general AI [settings](#) (6).

Finally, "Translate & Improve" gives you the option to save your current settings as a [macro](#) (7) to reuse them without manual program interaction via keyboard shortcuts later.

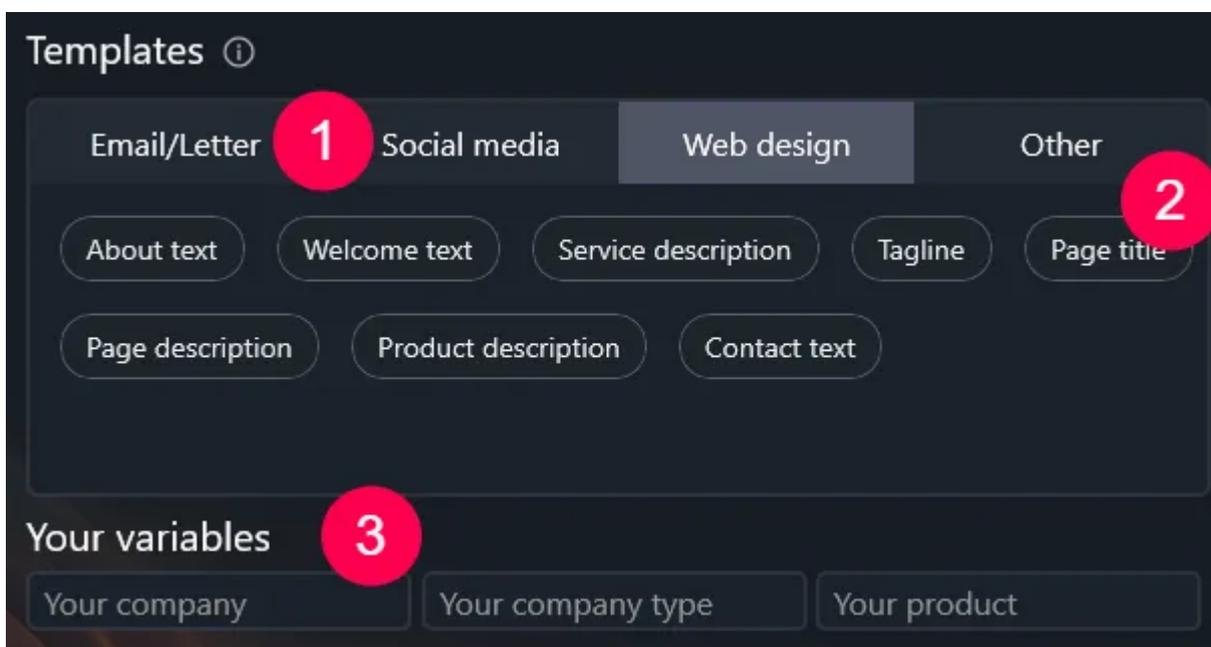

2. Translate & Improve

This feature revises existing texts. If you receive a text in a language unknown to you, you can use "Detect language" to find it out.

3. Generate Text

This feature generates text tailored to your requirements. Either formulate your task in the left text field or use one of the presets.

3.1 Presets

This section provides ready-made presets for various tasks (2) arranged by category (2). Some presets use placeholders (3) the content of which will be auto-inserted into the task description.

4. Analyze & Summarize

This feature examines existing texts with regard to intention, sentiment, etc. It can also summarize texts.

5. Interactive

If you ever wanted to have a direct conversation with AI, here's where you can do it.

Settings such as response length are accessible through the link below your message.

6. Settings

6.1 General

Select the user interface language here and determine how the program behaves when you minimize or close the application window.

Behavior

Use these settings to auto-insert text from the clipboard into Ashampoo AI Assistant when you use keyboard shortcuts and either replace or append to existing text.

6.2 Shortcuts & Macros

Shortcuts

Keyboard shortcuts allow you to instantly access individual program sections without the need for manual program activation.

For example, when you're writing an email, hitting Ctrl+C twice will instantly open "Translate & Improve" and auto-insert your selected text. Click the text fields to specify your own keys.

Shortcuts with text fields preceded by a single "Ctrl" are usable via Ctrl + your key.

Shortcuts with textfields preceded by "Ctrl + C" require that you first hit Ctrl + C followed by Ctrl + your key to use them.

Macros

You can think of macros as keyboard shortcuts with pre-determined parameters (like improve text and use friendly language). Unlike regular shortcuts, macros require no further interaction with Ashampoo AI Assistant and carry out operations in the background. Once complete, results will be auto-inserted into the currently active application e.g., MS Word.

All macros are based on "Translate & Improve".

Executing macros always requires pressing Ctrl + C followed by Ctrl + your key. The idea is that you first select text in your application e.g., MS Word, which gets copied to the system clipboard when you hit Ctrl + C. The macro then processes your text in the background and auto-inserts it into the application, replacing the selected text.

Click a list entry to modify an existing macro.

Create / Edit macro

Specify a name and select tonality and action to perform. Use "Key combination" to specify the shortcut to press after Ctrl + C to execute the macro.

6.3 AI settings

These settings affect text generation throughout the program. "Interactive Response" only applies to the "Interactive" feature.
